

Question 1. Short Answer Question

Fill in the box with the answer.

- *Removed in publishable version* -

Question 2. Coding 1

Complete the overridden method void addFirst

It is a method of the class DelimitedARDeque, and

It adds an item to the front of the object of Del

but it will throw an IllegalArgumentException if called more than once.

Test case:

```
DelimitedARDeque<String> dd = new DelimitedARDeque<>();
```

```
dd.addFirst("a");
```

```
dd.addFirst("b");
```

```
try {
```

```
    dd.addFirst("a");
```

```
    dd.printDeque();
```

```
} catch (IllegalArgumentException e) {
```

```
    System.out.println("AddFirst failed");
```

```
}
```

→ AddFirst failed

Question 3. Coding 2

Complete the method `boolean equals(Object o)` that overrides the one in `Object`.

To be the same, they must be of the same size and have the same items at the same position.

Suppose `[ ]` is an `ARDeque<Integer>`. Then:

`[1, 2, 3].equals([1, 2, 5])` → true

`[1, 3, 2].equals([1, 2, 3])` → false
