

Question 1. Short Answer Question

Fill in the box with the answer.

- *Removed in publishable version* –

Question 2. Coding 1

Complete the overridden method void addLast

It is a method of the class DelimitedARDeque, and

It adds an item at the back of the object of DelimitedARDeque

but it will throw an IllegalArgumentException if the item is added more than once.

Test case:

```
DelimitedARDeque<String> dd = new DelimitedARDeque(10);
```

```
dd.addLast("a");
```

```
dd.addLast("b");
```

```
try {
```

```
    dd.addLast("a");
```

```
    dd.printDeque();
```

```
} catch (IllegalArgumentException e) {
```

```
    System.out.println("AddLast failed");
```

```
}
```

→ AddLast failed

Question 3. Coding 2

Complete the method `boolean equals(Object o)` that overrides the one in `Object`.

To be the same, they must be of the same size and have the same items at the same position.

Suppose `[ ]` is an `ARDeque<Integer>`. Then:

`[1, 2, 3, 4].equals([1, 2, 5, 6])` →

`[1, 2, 3, 4].equals([1, 4, 2, 3])` →
